Automatic wallpaper changer app for iphone

In September, some brave iPhone users discovered that they could drastically change the look of their home screen by combining custom app icons with iOS 14's new home screen widgets. A new trend has reborn the joy that people have shown with wild creations on social media as well and technology has become more personal. But creating custom home screens in iOS 14 is a tedious work where users need to download dozens of app icons, create separate launch shortcuts for each, install corresponding widgets in apps like WidgetsSmith, and find a wallpaper to match. Not everyone has that time, energy or inclination. Fortunately, there is another way to refresh the home screen that does not take much work: just time automatic updates for wallpaper instead. With Apple's latest iOS 14.3 update, you can regularly set up new wallpapers from your camera roll, a specific photo album, and even online sources. It still takes a bit of installation, but it just beats having to spend hours customizing individual app icons or widgets to make your phone feel more personal. Here's how to start adding automatic wallpaper updates to your iPhone.

Set shortcuts to automatically refresh your wallpaper

The key to automatically changing your iPhone wallpaper is Apple's Shortcuts app, which triggers all kinds of special actions and events on your phone. Shortcuts starting with iOS 14.3 include the ability to set wallpaper on the home screen, lock screen, or both. By running these Shortcuts on a schedule, your backgrounds can be updated on their own. We will discuss some special Shortcuts to try and how we can automate them below. But first you need to prepare your iPhone with a few setup steps: go to Settings > General > Run Software Update and make sure you're running iOS 14.3, or choose Download and Install if you're not. After updating, go to Settings > Shortcuts and enable Allow Untrusted Shortcuts Data. (As scary as it sounds, it's necessary to install Shortcuts created by other users, such as:)

The fun part of Wallpaper Shortcuts for TryNow comes: By adding various Shortcuts to your phone, you can choose which wallpapers to use. To install a shortcut, you should listen to any of the following links when using your iPhone, go to the bottom of the Shortcut description, and then select Allow Data to Untrusted Shortcut. You can then choose whether shortcut adjusts your home screen, screen, or both.

Random Last Photo: This Shortcut selects one of your 50 most recent photos, not including screenshots, and adjusts them as background. Not the fanciest way to set up a wallpaper, but it works well if you are conscientious about removing bad or unwanted photos from the camera roll.

Portrait Photo: Same as above, but only for photos taken with iPhone's Portrait mode.

Random Wallpaper: For a little more control over which photos are selected, this shortcut selects a random image from an album called Wallpaper settings as your background. To use this Shortcut, you need to create an album in Apple's Photos app, call it Wallpaper, and add some pictures. (If you need some image sources, try Reddit's Wallpaper forum or Unsplash's Wallpaper section.)

Reddit Nature Wallpapers: My personal favorite is that this shortcut grabs a random final nature photo on Reddit's EarthPorn forum, then resizes it to fit the plants and iPhone screen. (Based on the thepixelatedbanana study with a few changes from my point of view.)

Reddit City Wallpapers: Same as above, but drawing instead of Reddit's CityPorn forum.

Dynamic Wallpapers: On Mac, Apple offers a suite of dynamic nature wallpapers that reflect the current time of day. This Shortcut by Tech AI adds a similar feature to iOS according to the time I will set in the next section. After installing any of the above Shortcuts, run them at least once through the Shortcuts app and accept a handful of permission requests for each. (With Dynamic Wallpapers, select Renew when running it for the first time, and select Skip Current Theme to choose between different wallpaper packages.)

Automating your wallpapers

Adding shortcuts above is only half the equation. To refresh your home screen regularly or lock your screen background, you'll also need to set scheduling rules in the Shortcuts app: Select the Automation tab in the Shortcuts app, and then tap the + button. Select Create Personal Automation, and then select Time of Day. Select a specific time to change your Sunrise, Sunset, or wallpaper, then press Next. In the Text field, tap Add Action, tap Run Shortcut, and then choose Run Shortcut. Tap the shortcut word, select one of the Wallpaper Shortcuts you installed above, and then tap Next. (Select Dynamic Wallpaper Automation shortcut for Dynamic Wallpapers.)

Unsee ask before running, then press Done. If you want your wallpaper to change more than once a day, just repeat the steps above to create additional timing rules. This works especially with Dynamic Wallpapers Shortcut, which offers different scenes for sunrise, morning, sunset and night. (Check the full shipment of Tech AI to set specific times.)

Also, if you want to stop seeing notifications when your wallpaper is refreshed, go to See All Activity > Screen Time > Settings, and then go to Notifications. Select Shortcuts from this section, and then switch so that Allow Notifications can be turned off. Another trick: Go to Settings > Accessibility > Touch > Touch Back to easily get a new wallpaper when you want. Select with double or three taps and then down to select any of the shortcuts above

Now you can renew your background by hitting the back of your phone. You'll never get bored with your home screen again. It is required to use the Settings app to change the Lock and Home screen wallpapers on your iPhone or iPad. Wouldn't it be great if you could change the wallpaper automatically? Was it? One faucet? You can do this with wallpaper automation available in iOS 14.3 and iPadOS 14.3. In this tutorial, we'll show you how to use a custom workflow in Apple's Shortcuts app to automate changing wallpaper with a single tap on a Home screen icon. This step-by-step tutorial will teach you how to use a simple third-party script that takes advantage of a new wallpaper automation feature in Apple's Shortcuts app. This allows you to change the wallpaper on your iPhone or iPad only by tapping an icon on your Home screen. If your device doesn't use iOS 14.3+, the shortcut does nothing. iOS and iPadOS 14.3 are currently being tested with developers and will be available to the public this year. This tutorial is based on a video walkthrough of Technical Beardo. To have an icon on your Home screen to change your wallpaper before automatically changing iPhone wallpaper, you need to perform the following operations in this special order: Let's reach it. Allow untrusted shortcuts

Because we use third-party scripting for the Shortcuts app instead of one of Apple's own, we first need to allow untrusted shortcuts on your device. Open the Settings app on your iPhone or iPad. Select Shortcuts from the root list. Slide the switch to the Off location next to the Allow Untrusted Shortcuts button. The Shortcuts app now allows you to import third-party scripts. Add wallpapers to the Photos album

Our special shortcut is waiting to find wallpaper images in a special album that we can create in Apple's stock Photos app. Open Photos on your iPhone or iPad. Tap the Library at the bottom. Press the Select button. Tap all the images you want to use as wallpapers. Tap the Share icon, then select Add to Album and select your Wallpaper album in

Photos. Now the photos should be a brand new album called Wallpaper, featuring all the images you want to use for our custom shortcut wallpaper rotation. With the shortcut app set to accept shortcuts that are not trusted and our ready-made wallpaper album in Photos, we will now import our custom shortcuts that do all the magic. Open the safari browser on your iPhone or iPad. Go to this link using Safari. Tap the Get Shortcut button. Scroll down and go to Add Untrusted Shortcut. The shortcut is transferred to the My Shortcuts section of the Shortcuts app. Permission to use photos Since this is a third-party shortcut, you need permission to access your Photos library. Tap my Shortcuts at the bottom of the Shortcut app on your iPhone or iPad. In the My Shortcuts section, tap the three points in the upper-right corner of the Wallpaper shortcut. Allow Access just below this shortcut does not access your photos message and tap OK to confirm the operation. Our custom script is now allowed to access Photos content. This action action at the bottom of the shortcut details screen It is not available in this version of Shortcuts, and with the Update Shortcuts button, you are using an iOS or iPadOS version greater than 14.3, and this script will not work for you. Do not enter Update Shortcuts as a no-touch option, because doing so will take you to the Software Update screen in Settings. If you are not on iOS 14.3 or iPadOS 14.3, you should expect Apple to release these software updates for general consumption. Add the shortcut to the Home screen last, we will create a Home screen icon for our custom Wallpaper script so that we can run it by tapping the icon instead of navigating the Shortcuts app. Open the Shortcuts app on your iPhone or iPad. Tap my Shortcuts at the bottom. Tap and hold the Improted Wallpaper shortcut, then select Share from the pop-up menu. Select Add to Home Screen. Customize the Shortcut's Home icon and name, and then tap Add. Now we have created a Home screen icon for the Wallpaper shortcut. Use the shortcut Everything is set and ready to use, you can now use this shortcut. Thanks to shortcut's Home screen icon and changes apple has made to the Shortcuts app on iOS and iPadOS 14.3, our shortcuts will execute quietly without showing you the shortcuts app. So, now when you tap the Wallpaper icon on the Home screen of iPhone or iPad, wallpaper in Photos changes your wallpaper using the images in your album. This is also a great way to use iDB's wallpaper collection, since now you can include the images you want in the rotation by adding them to the Wallpaper album in Photos. Previously you had to go to the special Wallpaper section in Settings and find the option to choose a new wallpaper, then you will navigate through your Photos library to find the right image. As you may have noticed, our custom script replaces this multi-stage process and is much more elegant. Elegant.
